Software Engineer II, Uber

Hello Uber,

As a software engineer with a background in chemistry, I specialize in designing multi-service architectures that automate document ingestion and enforce data integrity against strict regulatory standards. I am applying for the Software Engineer II position at Uber in Seattle as part of an upcoming, self-funded move to Seattle. I am able to relocate within three to four weeks prior to any start date. I am available to interview via phone or video call, and I would gladly travel to Seattle for an in-person interview to discuss the role further.

I believe that my experience in the cosmetic chemistry industry and creating software to alleviate manufacturing hurdles and FDA regulatory strain make your Software Engineer role building platforms for document workflows a fantastic fit. These are puzzles that I have spent the last five years learning, assimilating and building solutions for in the cosmetic industry and I am ready for new challenges.

In my current role at Essentials by Catalina, I created Lumexia: a multi-service manufacturing ERP software, currently helping two manufacturing facilities operate daily. To solve accuracy issues in manufacturing, I designed rule-based validation workflows that took IoT data from warehouse staff for evaluation before workflow advancement, which reduced corrective actions by 92%. The parametric pricing engine in Lumexia recalculates production costs against live material availability and commodity swings, preventing over \$400,000 in mispriced production runs. I also automated regulatory document generation by parsing supplier chemical documentation and using live data streams in internal calculators and generators, cutting manual compilation time from 52 hours to 2 hours.

My experience directly matches your technical requirements for document ingestion and regulated data processing. I have engineered tools that parse and extract structured data from technical supplier documents, and built integration platforms that resolve identity records against federal FDA databases. Working extensively with regulated data taught me to treat privacy, auditing, and schema constraints as non-negotiable software contracts.

Thank you for your time and consideration. I look forward to discussing how my experience can support your engineering team.

Isaac Vargas
